More than safety.

EUCHNER

More than safety.

Emil Euchner, the company's founder and inventor of the multiple limit switch, circa 1928.

Around the world – the Swabian specialists in motion sequence control for mechanical and systems engineering.

EUCHNER's history began in 1940 with the establishment of an engineering office by Emil Euchner. Since that time, EUCHNER has been involved in the design and development of switchgear for controlling a wide variety of motion sequences in mechanical and systems engineering. In 1953, Emil Euchner founded EUCHNER + Co., a milestone in the company's history. In 1952, he developed the first multiple limit switch – to this day a symbol of the enterprising spirit of this family-owned company.

Automation – Safety – ManMachine

Today, our products range from electromechanical and electronic components to complex system solutions. With this wide range of products we can provide the necessary technologies to offer the right solution for special requirements – regardless of whether these relate to reliable and precise positioning or to components and systems for safety engineering in the automation sector.

EUCHNER products are sold through a world-wide sales network of competent partners. With our closeness to the customer and the guarantee of reliable solutions throughout the globe, we enjoy the confidence of customers all over the world.

Quality, reliability, precision

Quality, reliability and precision are the hallmarks of our corporate philosophy. They represent concepts and values to which we feel totally committed.

At EUCHNER, quality means that all our employees take personal responsibility for the company as a whole and, in particular, for their own field of work. This individual commitment to perfection results in products which are ideally tailored to the customers' needs and the requirements of the market. After all: our customers and their needs are the focus of all our efforts. Through efficient and effective use of resources, the promotion of personal initiative and courage in finding unusual solutions to the benefit of our customers, we ensure a high level of customer satisfaction. We familiarize ourselves with their needs, requirements and products and we learn from the experiences of our customers' own customers.

EUCHNER – More than safety.

Quality – made by EUCHNER

General information

According to EN 1088, interlocking devices are mechanical or electrical devices which are designed to prevent the operation of a machine element for as long as the movable safety guard is left open.

Non-contact safety switches are interlocking devices which are designed to protect people and machines. Compared with electromechanical safety switches, they are used if:

- ▶ a high level of protection against tampering must be achieved
- ▶ extremely hygienic environmental conditions are required (e.g. in the food industry)
- ▶ a precise door guide is not possible
- ▶ machine doors are subjected to strong vibrations
- ▶ a high safety category is determined in the risk analysis

Functional description

The **C**oded **E**lectronic **S**afety switch **CES** manufactured by EUCHNER comprises three components:

- ▶ Coded actuator
- ▶ Read head
- ▶ Evaluation unit

The non-contact safety switches described here operate on the basis of a uniquely electronically coded actuator (transponder).

The name **transponder** is a combination of the two terms **transmitter** and **responder**.

The function of a transponder is easily explained: the transponder (actuator) receives and processes the electromagnetic field from a transceiver (read head), and the data signals are then sent back to the receiver (evaluation unit) as a response depending on the transponder coding.

This transponder technology has been used successfully in electronic immobilizers for many years by almost all automotive manufacturers.

Transponder technology is also used on the non-contact safety switches series CES from EUCHNER and is an advanced solution for a new safety concept.

Power is supplied and data transmitted to the coded actuator using a non-contact, inductive read head. The major advantage of the system is the battery-less actuator technology that will give the user many years of service-free operation.

Every transponder is unique and absolutely secure against tampering.

The configuration of the system can be changed using a "teach-in operation". In service new actuators can be taught very simply. Each delivered actuator possesses a unique electronic coding and so is a unique element in the system used. The code of the actuator cannot be reprogrammed.

Signal transmission between the actuator and the read head is achieved via a homogeneous field. It is permissible to rotate the actuator within the operating distance of the read head.

Thanks to the highly integrated circuits contained in the actuator and the read head, switches with transponder technology can be produced in units of virtually any tiny design. EUCHNER also supplies read heads and actuators in rectangular and circular designs, with or without plug connectors.

The read head is fastened to the fixed part of the safety guard and is connected to the evaluation unit via a two-core screened cable.

The actuator fastened to the safety guard is moved towards the read head by closing the door. When the switch-on distance is reached, power is supplied to the actuator by the inductive read head and data can be transferred.

The bit pattern read is compared with the code saved in the evaluation unit; if the data matches, the safety outputs are enabled and the door monitoring output OUT (semiconductor output) is also set HIGH.

Actuator and read head have a wide operating distance and a broad hysteresis. Misalignment of the doors will not result in the system switching off unintentionally. If, on the other hand, the actuator is positioned exactly at the limit of the switch-on distance, vibrations at the safety guard will not cause the machine to stop unintentionally.

Polling of the read head, "actuator present," is single-channel and dynamic. All potential faults (e.g. broken cable, short circuit, failure of the actuator) are reliably detected. Thanks to the redundant, diverse design of the evaluation unit in combination with two safety outputs, the evaluation unit enters the safe state with every detectable fault.

Your advantages

- ▶ Uniquely coded actuator
 - ▶ Every actuator is unique
 - ▶ Absolutely secure against tampering
- ▶ Homogeneous magnetic field
 - ▶ It is possible to rotate the actuator within the operating distance of the read head
- ▶ Actuator and read head have a wide operating distance and a broad hysteresis
 - ▶ Misalignment of the doors will not result in the system switching off unintentionally
 - ▶ Precise door guides are not required
- ▶ Fully encapsulated read head and actuator
 - ▶ Degree of protection IP 67
 - ▶ Can be used in harsh environment
- ▶ Dirt on the surface does not reduce the switching distance
- ▶ Flush installation in door panel is possible
- ▶ No static magnetic field between actuator and read head
 - ▶ Metallic parts are not attracted
- ▶ Housing materials for actuator and read head
 - ▶ Fortron (as standard)
 - ▶ PE-HD (housing material resistant to aggressive chemicals, e.g. acids and alkaline)
- ▶ Small design of the actuator and read head
 - ▶ Cube-shaped
 - ▶ Cylindrical
- ▶ Read head with M8 plug connector
 - ▶ Easy to replace in service
- ▶ Safety screws included
 - ▶ Protection against tampering
- ▶ Approvals from BG, SIBE, UL

Evaluation unit CES-A-ABA...

- ▶ **Housing for DIN rail mounting, IP 20**
- ▶ **Relay output**
- ▶ **1 read head can be connected**

Functional description

The **C**oded **E**lectronic **S**afety switch **CES** comprises three components:

- ▶ Coded actuator
- ▶ Read head
- ▶ Evaluation unit

The evaluation unit CES-A-ABA-01 is suitable for the direct connection of a read head, i.e. in each case, the code from only one actuator is read and processed.

The teaching of other actuators can be initiated with a teach-in operation. The teach-in operation can be performed up to 8 times with a new actuator; the actuator from the last teach-in is always the valid actuator. The evaluation unit in the DIN rail housing, degree of protection IP 20, is suitable for installation in the control cabinet.

The two-core connection cable to the evaluation unit is hard-wired to the read head or can be plugged in using a round M8 plug connector. In this way, the wiring work is reduced to an absolute minimum.

The read head is fastened to the fixed part of the safety guard and is connected to the evaluation unit via a two-core screened cable.

The actuator fastened to the movable part of the safety guard is moved towards the read head by closing the door. When the switch-on distance is reached, power is supplied to the actuator by the inductive read head and data can be transferred.

The bit pattern read is compared with the code saved in the evaluation unit; if the data matches, the safety outputs (relay output) are enabled and the door monitoring output OUT (semiconductor output) is also set HIGH.

Due to the combination of dynamic polling of the actuator and the redundant, diverse design of the safety electronics with the two safety outputs, the evaluation unit will enter the safe state with every detectable fault.

When the safety guard is opened, the safety outputs switch off the safety circuit and the door monitoring output (OUT) is switched LOW. The state of the safety outputs is monitored internally by positively driven NC contacts (relay output).

If an internal fault occurs in the evaluation unit, the safety circuit is switched off, the diagnostic output (ERROR) is set HIGH and the ERROR LED illuminates red.

The safety contacts on the safety switch CES can switch currents from 1 mA to 6 A. Since small currents can be switched, the user has the option of connecting the safety switch CES directly to a safe control system.

Safe control systems will become increasingly important as technology progresses.

With a switching capacity of DC 24 V / 6 A, the evaluation unit can be connected directly to the majority of power contactors, without further coupling modules.

Your advantages

- ▶ Evaluation unit teach-in function
 - ▶ New actuator teach-in can be performed without any other equipment
 - ▶ The number of teach-in operations is restricted to eight to provide security against tampering
- ▶ Two redundant relay outputs (safety outputs) with internally monitored contacts, suitable for:
 - ▶ Safety category 3 according to EN 954-1 (according to BG)
 - ▶ Safety category 4 according to EN 954-1 for monitoring short circuits of safety outputs (according to SIBE)
- ▶ Dynamic data transmission to the read head
 - ▶ All faults (e.g. broken cable, short circuit, failure of the actuator) are reliably detected
 - ▶ High safety due to dynamic performance
- ▶ Suitable for connection to a safe control system with or without pulse signals
- ▶ Several evaluation units can be connected in series
 - ▶ Suitable for monitoring systems with several safety guards
- ▶ Switching capacity DC 24 V / 6 A
 - ▶ Direct connection to power contactor possible without extra coupling modules
- ▶ Self-test without opening the safety guard
- ▶ Monitoring output available
 - ▶ Control system can poll the state of the safety guard
- ▶ Fault diagnostics possible using LED indicator
- ▶ Coded plug-in terminals
 - ▶ Avoidance of faults in service
- ▶ Large operating distance of 6 mm (CES-A-ABA-01) and 15 mm (CES-A-ABA-01B) with additional hysteresis
 - ▶ Large mechanical tolerances possible for door guide
- ▶ Approvals from BG, UL, SIBE

Notes on the electrical connection

- All the electrical connections must either be isolated from the mains supply by a safety transformer according to EN/IEC 61558 with limited output voltage in the event of a fault, or by other equivalent isolation measures.
- The plug-in and coded terminals on the evaluation unit enable the cable connections to be pre-assembled and so facilitate rapid final installation.
- The H1/H2, ERR and OUT connections are not short circuit-proof.
- If a common power supply is used, all the inductive and capacitive loads (e.g. contactors) connected to the power supply must be connected to appropriate interference suppression units.

Notes on installation

The evaluation unit must be mounted in a control cabinet with a minimum degree of protection of IP 54. A snap-in element on the back of the evaluation unit is used for fastening to the standard rail (35 mm DIN rail).

Safety precautions

- The evaluation unit has a redundant switching design with self-monitoring. This means that the safety system is still effective even if a component fails.
- The door monitoring output OUT is not fail-safe (not a safety output).
- To ensure safety, it is imperative that the safety outputs 13/14 and 23/24 are connected.

			- Internal electronics fault	
			- Invalid teach-in operation	

1) If a switching current > 300 mA is switched once using the relay outputs, it is no longer possible to reliably switch small currents (< 10 mA) due to the contact erosion on the gold contacts.

2) Corresponds to the risk time according to EN 60947-5-3. This is the maximum switch-off delay for the safety outputs following removal of the actuator.

3) The fault detection time is the time for the detection of an internal fault in the device. At least one of the relay outputs is opened safely. The welding of one of the relay contacts is only detected after the safety guard is opened.

4) After the operating voltage is switched on, the relay outputs are switched off and the door auxiliary contact is set LOW during the ready delay.

5) The dwell time of an actuator inside and outside the operating distance must be at least 0.5 s to ensure reliable detection of internal faults in the evaluation unit (self-monitoring).

6) Not short circuit-proof

7) In case of monitoring with feedback loop, the actuators must remain outside the operating distance, e.g. with a door open, until the feedback circuit is closed.

Wiring and block diagram CES-A-ABA...

System functions evaluation unit CES-A-ABA...

Teach-in function for actuator

The actuator must be allocated to the evaluation unit using a teach-in function before the system forms a functional unit.

During a teach-in operation, the safety outputs and the door monitoring output are LOW, i.e. the system is in the safe state.

Teach-in function for first actuator

(default setting on delivery)

- ① Apply the operating voltage to the evaluation unit
 - green LED flashes fast (approx. 4 Hz)
- ② Move actuator to the read head
(Observe distance < S_{a0})
 - teach-in operation starts, green LED flashes slowly (approx. 1 Hz)
- ③ Teach-in operation completed (after 60 seconds)
 - green LED goes out
- ④ To activate the actuator code from the teach-in operation in the evaluation unit, the operating voltage must then be switched off for min. 10 seconds.

Notes

- Repeated teach-in of the same actuator on the same evaluation unit is not possible
- The number of teach-in operations on one evaluation unit is limited to a maximum of 8
- The evaluation unit can only be operated with the last actuator taught
- A teach-in operation is invalid if:
 - The teach-in operation is cancelled before the green flashing LED goes out
 - The power supply is switched off during the teach-in operation
- When switching on the evaluation unit (application of operating voltage), the STATE LED signals the number of possible remaining teach-in operations (see system status table)

Function test (self-test)

On electromechanical safety switches or magnetic switches, the function test can be performed by cyclically opening the safety guard. From safety category 2, according to EN 60204-1 : 1997 (sec. 9.4.2.4), a function test must be performed on the entire safety system on start-up or after defined intervals.

The testing of the internal function of the safety switch CES is not necessary because the device monitors itself in real time. Wear on an output contact (relay output) is detected by the device at the latest the next time the safety guard is opened. A short circuit in the output cable is not detected by the device. In addition, the entire safety circuit can be tested without opening the safety guard.

Teach-in function for a new actuator

- ① Apply the operating voltage to the evaluation unit
- ② Move new actuator to the read head
(Observe distance < S_{a0})
 - teach-in operation starts, green LED flashes (approx. 1 Hz)
- ③ Teach-in operation completed (after 60 seconds)
 - green LED goes out, new code saved, old code deactivated
- ④ To activate the new actuator code from the teach-in operation in the evaluation unit, the operating voltage must then be switched off for min. 10 seconds.

Warning

- After the eighth teach-in operation or if an "old" actuator is placed against the actuator head, the system automatically switches to the teach-in mode. In both cases, a teach-in operation with a duration of 60 seconds is started; however, the last actuator code remains active (see system status table) in the memory - a new code is not taught.

For this purpose, the opening of the safety guard can be simulated by applying DC 24 V to the test input TST.

The safety outputs are switched off, enabling testing of the complete safety circuit. The diagnostic output ERR on the evaluation unit is also set HIGH as a monitoring function.

When the test input TST is reset, the evaluation unit resets the diagnostic output ERR to LOW, the red LED switches off and the safety outputs are switched on again. This permits self-testing of the safety system without opening the safety guard.

In the *Manual start* operating mode, the start button must be pressed again to start the system.

Evaluation unit CES-A-AEA...

- ▶ Housing for DIN rail mounting, IP 20
- ▶ Relay output
- ▶ 2 or 4 read heads can be connected

Functional description

The **C**oded **E**lectronic **S**afety switch **CES** comprises three components:

- ▶ Coded actuator
- ▶ Read head
- ▶ Evaluation unit

Based on the concept of the safety switch CES-A-ABA..., the evaluation units described in this chapter have the option of connecting 1...2 or 1...4 read heads. As a result, up to four safety guards can be monitored. The evaluation unit also has connection terminals for a start button and for the feedback loop for monitoring power contactors. The start button and the feedback loop are monitored for short-circuits.

The following settings can be made optionally using DIP switches on the evaluation unit:

- ▶ Number of read heads 1...2 or 1...4
- ▶ Manual or automatic start
- ▶ Operation with or without feedback loop

The configuration of the entire system can be changed as often as required using a "teach-in operation". After appropriate preparations (fitting a jumper to the evaluation unit), a new actuator can also be taught-in as often as required in service.

The non-contact safety switch CES-A-AEA... has a relatively large operating distance of 15 mm. Compared with mechanical safety switches, the assembly of the unit is much easier and the need for precision in the door rails is also reduced considerably. Therefore the assembly and maintenance costs are much lower. The two-core connection cable to the evaluation unit is hard-wired to the read head or can be plugged in using a round M8 plug connector. In this way, the wiring work is reduced to an absolute minimum.

The read heads are fastened to the fixed part of the safety guard and are each connected to the evaluation unit via a two-core screened cable. The actuator fastened to the movable part of the safety guard is moved towards the read head by closing the door. When the switch-on distance is reached, power is supplied to the actuator by the inductive read head and data can be transferred.

The bit pattern read is compared with the code saved in the evaluation unit. If the data match, the door monitoring output O1...O2 or O1...O4 (semiconductor output) on the related read head is set HIGH. If all data for all read heads activated match, the safety outputs (relay outputs) are then enabled. The OUT LED illuminates.

Due to the combination of dynamic polling of the actuators and the redundant, diverse design of the safety electronics with the two safety outputs, the evaluation unit will enter the safe state with every conceivable fault.

When a safety guard is opened, the safety outputs switch off the safety circuit and the OUT LED goes out. The state of the safety outputs is monitored internally by positively driven NC contacts (relay output). Independent of the switching state of the safety circuit, the position of all safety doors can be polled via the outputs O1...O2 or O1...O4.

If an internal fault occurs in the evaluation unit, the safety circuit is switched off, the diagnostic output (DIA) is set HIGH and the DIA LED illuminates red.

The start button is also monitored. This is achieved by evaluating the falling edge of the start signal. In this way it is not possible for a signal continuously present on the input of the evaluation unit (e.g. stuck button contact) to result in the automatic start of the system.

The evaluation unit provides the option of monitoring power contactors connected in series.

The evaluation unit can only be started with the feedback loop closed. A welded contactor contact in the release path will thus be detected when a start request is made.

The safety contacts on the new evaluation unit can switch switching currents from 1 mA to 6 A. Since small currents can be switched, the user has the option of connecting the safety switch CES directly to a safe control system. Safe control systems will become increasingly important as technology progresses.

With a switching capacity of DC 24 V / 6 A or AC 230 V / 1.5 A, the evaluation unit can be connected directly to the majority of power contactors, without further coupling modules.

With its new safety switch CES, EUCHNER has introduced an integrated solution on the market. With a single system, the user can realize such applications as the monitoring of safety guards, wiring, evaluation and even the monitoring of externally connected devices. The user thus achieves maximum safety at a reasonable cost without the need for further equipment, e.g. emergency-stop switchgear.

Due to the internal design of the device and the monitoring facility for the external connected devices, the non-contact safety switch CES-A-AEA... can be used for the highest safety requirements of safety category 4 according to EN 954-1 with approval from BG and SIBE Switzerland.

Your advantages

- ▶ Evaluation units for the connection of 1 ... 2 or 1 ... 4 read heads
 - Selectable via DIP switches:
 - ▶ Number of read heads (1...4)
 - ▶ Manual or automatic start
 - ▶ Operation with or without a feedback loop for monitoring power contactors
- ▶ Monitored start button and feedback loop
 - ▶ Short circuits are reliably detected
- ▶ Evaluation unit teach-in function
 - ▶ Teach-in of a new actuator using simple aids (fitting a jumper to the evaluation unit)
 - ▶ Unlimited number of teach-in operations possible
- ▶ Two redundant relay outputs (safety outputs) with internally monitored contacts, suitable for:
 - ▶ Safety category 4 according to EN 954-1 (according to BG and SIBE)
- ▶ Dynamic data transmission to the read head
 - ▶ All faults (e.g. broken cable, short circuit, failure of the actuator) are reliably detected
 - ▶ High safety due to dynamic performance
- ▶ Suitable for connection to a safe control system with or without pulse signals
- ▶ Several evaluation units can be connected in series
 - ▶ Suitable for monitoring systems with several safety guards
- ▶ Switching capacities DC 24 V / 6 A or AC 230 V / 1.5 A
 - ▶ Direct connection to power contactor possible without extra coupling modules
- ▶ Self-test without opening the safety guard
- ▶ Monitoring output available
 - ▶ Control system can poll the state of the safety guard
- ▶ Fault diagnostics possible using LED indicator
- ▶ Large operating distance and 15 mm with additional hysteresis
 - ▶ Large mechanical tolerances possible for door guide
- ▶ Approvals from BG, UL, SIBE

Evaluation unit CES-A-AEA-02B

- ▶ Housing for DIN rail mounting, IP 20
- ▶ Relay output
- ▶ 2 read heads can be connected
- ▶ In combination with read head CES-A-L... and actuator CES-A-B..

SIBE
Schweiz

Dimension drawing

Switching characteristics

- 2 safety outputs (relay outputs)
- 2 door monitoring outputs (semiconductor outputs, not safety outputs)

Safety guard		
closed (all actuators detected)		open (e.g. actuator 1 not in the operating distance)
Read head 1	Actuator 1	Read head 1
13 — 14		13 — 14
23 — 24		23 — 24
24 V — O1		24 V — O1
24 V — O2		24 V — O2

Notes on the electrical connection

- ▶ All the electrical connections must either be isolated from the mains supply by a safety transformer according to EN/IEC 61558 with limited output voltage in the event of a fault, or by other equivalent isolation measures.
- ▶ The connections H1a/H1b ... H2a/H2b are not short circuit-proof.
- ▶ If a common power supply is used, all the inductive and capacitive loads (e.g. contactors) connected to the power supply must be connected to appropriate interference suppression units.

Notes on installation

The evaluation unit must be mounted in a control cabinet with a minimum degree of protection of IP 54. A snap-in element on the back of the evaluation unit is used for fastening to the standard rail (35 mm DIN rail).

Safety precautions

- ▶ The evaluation unit has a redundant switching design with self-monitoring. This means that the safety system is still effective even if a component fails.
- ▶ The door monitoring outputs O1 ... O2 are not fail-safe (not safety outputs)
- ▶ To ensure safety, both safety outputs 13/14 and 23/24 must always be evaluated.

EMC protection requirements	as per IEC/EN 60947-5-3			

1) If a switching current > 300 mA in conjunction with a switching voltage > 15 V or an inductive or capacitive load is switched once using the relay outputs, it is no longer possible to reliably switch small currents (< 15 mA) due to the contact erosion on the gold contacts.

2) Corresponds to the risk time according to EN 60947-5-3. This is the maximum switch-off delay for the safety outputs following removal of the actuator.

3) The fault detection time is the time for the detection of an internal fault in the device. At least one of the relay outputs is opened safely. The welding of one of the relay contacts is only detected after the safety guard is opened.

4) After the operating voltage is switched on, the relay outputs are switched off and the monitoring outputs are set LOW during the ready delay. For the visual indication of the delay, the green STATE LED flashes at a frequency of approx. 15 Hz.

5) In case of monitoring with feedback loop, the actuators must remain outside the operating distance, e.g. with a door open, until the feedback circuit is closed.

6) Without taking into account the load currents on the monitoring outputs.

Wiring and block diagram CES-A-AEA-02B

Wiring and block diagram CES-A-AEA-04B

System functions evaluation unit CES-A-AEA...

Setup procedure

During setup, the parameters are set in the evaluation unit by the user using a teach-in operation (number of connected read heads, assignment of the actuators to the read heads, with or without automatic start, with or without feedback loop). During this process the read heads are activated.

These configuration parameters are saved in the non-volatile memory in the evaluation unit.

To trigger a teach-in operation, the user must perform the following actions in the stipulated order:

- ① Prepare for teach-in operation
 - Switch off power supply U_B
 - Fit a jumper between terminals J1 and J2
- ② Set required configuration on DIP switches

Switch marking	Slider position left (OFF)	Slider position right (ON)
1	No read head connected to terminals H1a, H1b, SH1	Read head connected to terminals H1a, H1b, SH1
2	No read head connected to terminals H2a, H2b, SH2	Read head connected to terminals H2a, H2b, SH2
3	No read head connected to terminals H3a, H3b, SH3	Read head connected to terminals H3a, H3b, SH3
4	No read head connected to terminals H4a, H4b, SH4	Read head connected to terminals H4a, H4b, SH4
5	Automatic start (No start button connected)	Manual start (Start button connected)
6	No feedback loop connected	Feedback loop connected

- ③ Set required configuration on machine
 - Close all doors to be monitored (the actuators must be in the operating distance of the related read head)
 - For **Manual start** operating mode: connect terminal S to 24 V (or keep start button pressed)
 - For **With feedback loop** operating mode: keep feedback loop closed
- ④ Start teach-in operation
 - Switch on operating voltage
 - Wait for self-test (STATE LED flashes for approx. 10 seconds at 15 Hz)
 - Teach-in operation starts (STATE LED flashes at approx. 1 Hz)
 - Wait for acknowledgement of the teach-in operation (STATE LED goes out after approx. 10 seconds)
- ⑤ End teach-in operation
 - Switch off operating voltage for at least 10 seconds
 - Remove jumper between J1 and J2
 - For **Manual start** operating mode: connect start button to terminal S
 - For **With feedback loop** operating mode: connect feedback loop
 - Switch on operating voltage
 - Wait for self-test (STATE LED flashes for approx. 10 seconds at 15 Hz)

- ⑥ ⚠ **Check all safety guards for effectiveness** ⚠

Note

During the teach-in operation the following conditions must be met:

- There must be no state change, e.g. opening a safety door or closing a further safety door
- The power supply must not be switched off

If these conditions are not met, the evaluation unit switches to the safe fault state (diagnostics LED illuminates) and signals this operating fault with the STATE LED by 3 short flashes that are repeated every second. The teach-in operation must be repeated.

Warning

- The number of teach-in operations is unlimited. The evaluation unit can be re-configured as often as required.
- Actuators cannot be interchanged without a renewed teach-in operation.
- An actuator that has not been subjected to teach-in will not be detected by the related read head.
- Even if only one new actuator needs to be taught, a complete new teach-in operation must be carried out as described in the section "Setup procedure".
- Do not change DIP switches during operation.

Function test CES-A-AEA... (self-test)

On electromechanical safety switches or magnetic switches, the function test can be performed by cyclically opening the safety guard. From safety category 2, according to IEC/EN 60204-1 : 1997 (sec. 9.4.2.4), a function test must be performed on the entire safety system on start-up or after defined intervals.

The testing of the internal function of the safety switch CES is not necessary because the device monitors itself in real time. Wear on an output contact (relay output) is detected by the device at the latest the next time the safety guard is opened. A short circuit in the output cable is not detected by the device.

In addition, the entire safety circuit can be tested without opening the safety guard. For this purpose the opening of the safety guard can be simulated by applying DC 24 V to the test input.

The safety outputs are switched off, enabling testing of the complete safety circuit. The diagnostic output DIA of the evaluation unit is also set HIGH as a monitoring function.

When the test input is reset, the evaluation unit resets the diagnostic output DIA to LOW, the red LED switches off and normal operation continues. This permits self-testing of the safety system without opening the safety guard.

LED indicators

LED labels	LED color	Significance
STATE	Green	State display (multifunction display using flashing modes)
OUT	Yellow	Safety circuit closed
DIA	Red	Operating fault, external fault (fault in the feedback loop) or internal device fault TST input activated (function test active)

System status table CES-A-AEA-04B

STATE LED (green)	OUT LED (yellow)	DIA LED (red)	State
Setup			
Flashes continuously at approx. 4 Hz	Off	Off	Initial setup after delivery without jumper connected to J1, J2
Flashes at approx. 1 Hz	Off	Off	Teach-in operation
Off	Off	Off	Acknowledgement of completion of teach-in operation
Normal operation			
Flashes at approx. 15 Hz	Off	Off	Self-test, duration approx. 10 seconds, is performed after the application of the operating voltage U_B
On	Off	Off	Normal operation, not all monitored doors are closed
On	On	Off	Normal operation, all monitored doors are closed (After pressing the start button, for Manual start operating mode)
Function test			
On	Off	On	Function test active (TST input = 24 V)
Fault display			
Off	Off	On	Component failure inside the device or actuator in the operating distance for less than 0.5 s or actuator CES-A-BMB in the inadmissible range
Operating fault			
3 flashes repeated after 1 s	Off	On	Configuration fault: Teach-in operation must be performed again Possible causes: <ul style="list-style-type: none"> - State change during the teach-in operation - None of the DIP switches in ON position - DIP switch setting and connected configuration did not match during teach-in operation - DIP switch setting has been changed without teach-in operation - The teach-in jumper (J1, J2) was fitted with power supply switched on - Connected feedback loop (Y1,Y2) present, although a feedback loop was not present during teach-in - 24 V signal present at the start button input (S) although teach-in was performed with "Automatic start" operating mode
4 flashes repeated after 1 s	Off	On	Fault in feedback loop

Non-contact safety switches CES-A-C5...

- ▶ **Standard housing according to IEC/EN 60947-5-2, IP 67**
- ▶ **Read head and evaluation unit integrated in the standard housing**
- ▶ **Semiconductor output**
- ▶ **Connection of the safety circuit using M12 plug connector**

Functional description

The **C**oded **E**lectronic **S**afety switch **CES** comprises two components:

- ▶ Coded actuator
- ▶ Evaluation unit / read head

The evaluation unit described in this chapter is integrated with the read head in a standard housing according to IEC/EN 60947-5-2.

Thanks to the high degree of protection IP67, this switch can be used directly on the safety guard in a very harsh environment. Semiconductor technology allows for a compact design of the evaluation unit and wear-free switching with a theoretically unlimited number of operating cycles.

The information from the coded actuator is read by the evaluation unit and processed at the same point. The transfer of static signals (information on whether door open or closed) to the higher level switchgear permits the use of connecting cables up to 300 m long with the system.

Serial wiring, i.e. the cascading of several evaluation units, is possible. In this way, you can implement decentralized wiring concepts with the safety switch CES.

Specifically, the major advantage of the system is that the positioning of the evaluation unit directly at the safety guard saves space in the control cabinet.

The system operator can read the current state of the safety switch on the two LED indicators (one with double function). If the actuator is in the operating distance, the OUT LED illuminates yellow. Even a possible fault in the evaluation unit is displayed by a red LED. In service, the safety switch connected with an M12 plug connector can be replaced in seconds. The required approach direction can also be set quickly on the compact housing. After two fastening screws have been undone, the active face of the read head can be set in 5 different positions.

The non-contact safety switch CES-A-C5E... has a relatively large operating distance of 20 mm. Compared with mechanical safety switches, the assembly of the unit is much easier and the need for precision in the door rails is also reduced considerably. Therefore the assembly and maintenance costs are much lower.

The safety switch with integrated evaluation unit and read head is fastened to the fixed part of the safety guard.

The actuator attached to the movable part of the safety guard is moved towards the read head fitted in the safety switch by closing the doors. When the switch-on distance is reached, power is supplied to the actuator by the inductive read head and data can be transferred.

The bit pattern read is compared with the code saved in the evaluation unit; if the data matches, the safety outputs (semiconductor outputs) and the door monitoring output (semiconductor output) are also set HIGH.

Due to the combination of dynamic polling of the actuator and the redundant, diverse design of the safety electronics with the two feedback safety outputs, the evaluation unit will enter the safe state with every detectable fault.

When the safety guard is opened, the safety outputs switch off the safety circuit and the door monitoring output (OUT) is switched LOW. The state of the safety outputs is monitored internally by two microprocessors.

On an internal fault in the evaluation unit, the safety circuit is switched off and the OUT/ERROR LED illuminates red.

The evaluation unit has a redundant switching design with self-monitoring. This means that the safety system is still effective even if a component fails.

Your advantages

- ▶ Evaluation unit teach-in function
 - ▶ New actuator teach-in can be performed without any other equipment
 - ▶ The number of teach-in operations is restricted to eight to provide security against tampering
- ▶ Safety switch in standard housing according to IEC/EN 60947-5-2
- ▶ Two redundant design semiconductor outputs (safety outputs) with internal monitoring:
 - ▶ CES-A-C5E-01: Safety category 3 according to EN 954-1 (according to BG and SIBE Switzerland)
 - ▶ CES-A-C5H-01: Safety category 4 according to EN 954-1 (according to BG and SIBE Switzerland)
- ▶ Read head and evaluation unit form a compact unit
 - ▶ Reduction of wiring faults during setup
- ▶ Relocation of the evaluation unit from the control cabinet to the system
 - ▶ Space-saving in the control cabinet
 - ▶ Decentralized wiring concept possible
- ▶ Connection via M12 plug connector
 - ▶ Prevention of wiring faults
- ▶ Easy adjustment of the read head in 5 approach directions
- ▶ Short circuit-proof monitoring and safety outputs
 - ▶ High reliability
- ▶ Large operating distance of 20 mm with additional hysteresis
 - ▶ Large mechanical tolerances possible for door guide
- ▶ Small design of the actuator (cube-shaped)
- ▶ Flush installation in door panel is possible
- ▶ Approval from BG

Safety switch CES-A-C5...

- Read head and evaluation unit integrated in the standard housing
- Semiconductor output
- Connection via M12 plug connector
(Connection cable see page 65)
- In combination with actuator CES-A-BBA

SIBE
Schweiz

Dimension drawing

Switching characteristics

2 safety outputs (semiconductor outputs)
1 door monitoring output (semiconductor output, not a safety output)

Safety guard	
closed (actuator detected)	open (actuator not in operating distance)
Read head	Read head
+LA ———— LA	+LA ———— LA
+LB ———— LB	+LB ———— LB
24 V ———— OUT	24 V ———— OUT

Notes on the electrical connection

- The operating voltage U_B is reverse polarity protected.
The contacts LA/LB, -LA/-LB and OUT are short circuit-proof, however they are not reverse polarity protected
- All the electrical connections must either be isolated from the mains supply by a safety transformer according to EN/IEC 61558 with limited output voltage in the event of a fault, or by other equivalent isolation measures.
- If a common power supply is used, all the inductive and capacitive loads (e.g. contactors) connected to the power supply must be connected to appropriate interference suppression units.

Safety precautions

To ensure safety, both safety outputs (LA and LB) must always be evaluated.

Changing the approach direction

The active face of the read head can be adjusted in 5 directions. The face is marked with the EUCHNER logo. The center of the circle corresponds to the middle of the read head.

Typical operating distance (only in conjunction with actuator CES-A-BBA)

For a side approach direction for the actuator and safety switch, a minimum distance of $s = 3$ mm must be maintained so that the operating distance of the side lobes is not entered.

1) Values at a switching current of 50 mA without taking into account the cable lengths.

2) Corresponds to the risk time according to EN 60947-5-3. This is the maximum switch-off delay for the safety outputs following removal of the actuator.

3) The fault detection time is the time for the detection of an internal fault in the device. At least one of the semiconductor outputs is switched off safely.

4) After the operating voltage is switched on, the semiconductor outputs are switched off and the monitoring outputs are set LOW during the ready delay.

5) The dwell time of an actuator inside and outside the operating distance must be at least 0.5 s to ensure reliable detection of internal faults in the evaluation unit (self-monitoring).

6) The values apply for surface installation of the actuator.

Teach-in function for actuator

The actuator must be allocated to the evaluation unit using a teach-in function before the system forms a functional unit.
During a teach-in operation, the safety outputs and the door monitoring output OUT are LOW, i.e. the system is in the safe state.

Teach-in function for first actuator

(default setting on delivery)

- ① Apply the operating voltage to the evaluation unit
 - ▶ green LED flashes fast (approx. 4 Hz)
- ② Move actuator to the read head
(Observe distance $< S_{a0}$)
 - ▶ teach-in operation starts, green LED flashes slowly (approx. 1 Hz)
- ③ Teach-in operation completed (after 60 seconds)
 - ▶ green LED goes out
- ④ To activate the actuator code from the teach-in operation in the evaluation unit, the operating voltage must then be switched off for min. 10 seconds.

Teach-in function for a new actuator

- ① Apply the operating voltage to the evaluation unit
- ② Move new actuator to the read head
(Observe distance $< S_{a0}$)
 - ▶ teach-in operation starts, green LED flashes (approx. 1 Hz)
- ③ Teach-in operation completed (after 60 seconds)
 - ▶ green LED goes out, new code saved, old code deactivated
- ④ To activate the new actuator code from the teach-in operation in the evaluation unit, the operating voltage must then be switched off for min. 10 seconds.

Note

- ▶ Repeated teach-in of the same actuator on the same evaluation unit is not possible
- ▶ The number of teach-in operations on one evaluation unit is limited to a maximum of 8
- ▶ The evaluation unit can only be operated with the last actuator taught
- ▶ A teach-in operation is invalid if:
 - ▶ The teach-in operation is cancelled before the green LED goes out
 - ▶ The power supply is switched off during the teach-in operation
- ▶ When switching on the evaluation unit (application of operating voltage), the STATE LED signals the number of possible remaining teach-in operations (see system status table)

Warning

- ▶ After the eighth teach-in operation or if an "old" actuator is placed against the read head, the system automatically switches to the teach-in mode. In both cases, a teach-in operation with a duration of 60 seconds is started; however, the last actuator code remains active (see status table) - a new code is not taught.

Non-contact safety switches CES-A-S5...

- ▶ **Standard housing according to IEC/EN 60947-5-2, IP 67**
- ▶ **Read head and evaluation unit integrated in the standard housing**
- ▶ **Semiconductor output**
- ▶ **Connection of the safety circuit using M12 plug connector**

Functional description

The non-contact safety switch CES-A-S5H-01 combines two different functions in one device:

- ▶ Safety function
- ▶ Identification function/position sensor

The **safety function** is the same as the functionality of the EUCHNER safety switch CES-A-C5H-01 in the compact housing with semiconductor output employing proven transponder technology:

- ▶ Two safety semiconductor outputs LA and LB signal the presence of a safety actuator and the closed position of the safety guard.
- ▶ Every safety actuator is unique, the actuator can be used with all non-contact EUCHNER safety switches CES.

The **identification function** or **position sensor** in the device is largely identical to the EUCHNER identification system CIS3 and its proven read head CIT3PL:

- ▶ Using 14 different position actuators, 14 different positions of a moving guard can be detected.

Every position actuator has a number that is saved in the integrated transponder.

For ease of use during installation and maintenance of the system, laser marking is used to apply the related transponder number in plain text to the housing of the position actuators. In addition, for clear differentiation between the actuators, different housing colors are used for safety actuators (red) and position actuators (green).

The related transponder number 2, 3, 4...9, A, B...F for the position actuator (in total 14 different dogs) is signaled to the higher level control system using the 4 semiconductor outputs D0, D1, D2, D3 in binary code. These data outputs have no safety function.

The position actuators cannot switch the safety outputs LA and LB. The safety outputs on the switch are only activated by the current safety actuator.

The safety actuator is always signaled on the data outputs as number 1 (0001)

(The no. 1 on the 4 data outputs corresponds to the OUT output on the EUCHNER safety switches CES-A-C5...).

Using the binary code 0000 it is signaled that neither the safety actuators nor a position actuator is within the operating distance of the read head (see pulse diagram on page 35).

Using 4 yellow LEDs (D0, D1, D2, D3) on the safety switch, the data outputs currently set are indicated visually based on the actuators within the operating distance.

The non-contact switch CES-A-S5H-01 has a large operating distance of 20 mm for the safety actuators and the position actuators. Compared to mechanical safety switches, significantly less effort is required here for the adjustment of the door guide.

The maximum relative speed of the position actuator towards the read head is extremely high and is max. 2.0 m/sec. To enable the higher level control system to reliably detect the signals read, the position actuators are "stretched" electronically, i.e. the signals remain set on the data outputs D0, D1, D2, D3 for an additional delay of approx. 0.2 seconds.

With conventional transponder systems, undefined states occur if the transponder is at the edge of the operating distance. These states manifest themselves in the form of irregular state changes and the flickering of the optical indicators.

The EUCHNER safety switches CES are equipped with a special internal circuit. This circuit provides exact operating points for the approach and removal (with shutdown hysteresis) of the actuators (transponder) with the following advantages:

- ▶ Reliable operation is ensured at all permissible movement speeds
- ▶ Sporadic failure to detect the transponder or the reading of incorrect data is effectively prevented.

If the actuator is positioned exactly at the limit of the switch-on distance, vibrations at the safety guard will not cause the machine to stop unintentionally.

A possible application example for the safety switch CES-A-S5H-01 is the monitoring of automatic roller doors.

Instead of fastening, adjusting and wiring several mechanical position switches as well as two electromechanical safety switches, it is only necessary to fasten the safety switch CES-A-S5H-01 (safety category 4) to the stationary part of the safety guard and connect it using a 12-pin plug connector.

The position actuators (dogs) are mounted at the necessary positions of the moving part of the safety guard. The safety actuator is fitted with the safety guard in the closed position. As a result the roller door can be closed at high speed (max. 2.0 m/s). On the detection of the last position actuator, the number of the actuator is forwarded over the data outputs to the control system and the roller door speed reduced. When the safety guard (roller door) is in the closed position, the safety actuator is detected, the safety outputs on the CES-A-S5H-01 switched and the system can be started.

The fastening and wiring effort for the mechanical position switches is reduced to zero.

In addition, all further advantages of non-contact transponder technology such as freedom from wear, large operating distance with highly tolerant door guiding.

Your advantages

- ▶ Safety and identification functions integrated into one switch
- ▶ Detection of 14 different position actuators
- ▶ High approach speed (2.0 m/s) of the position actuators
- ▶ Safety switch in standard housing according to EN 60947-5-2
 - ▶ Read head and evaluation unit form a compact unit
- ▶ Relocation of the evaluation unit from the control cabinet to the system
 - ▶ Space-saving in the control cabinet
 - ▶ Decentralized wiring concept possible
- ▶ Two redundant design semiconductor outputs (safety outputs) with internal monitoring
- ▶ Connection using 12-pin plug connector
 - ▶ Reduction of wiring faults during setup
- ▶ Safety category 4 according to EN 954-1
- ▶ BG approval (approval pending)

Safety Switch CES-A-S5H-01

- **Safety and identification functions**
- **Read head and evaluation unit integrated in the standard housing**
- **Semiconductor output**
- **Connection using 12-pin plug connector** (Plug connector see page 66)
- **In combination with safety actuator CES-A-BBA and position actuator CES-A-NBA.**

Dimension drawing

+LA ———— LA		+LA ———— LA	
+LB ———— LB		+LB ———— LB	
24 V ———— D0		24 V ———— D0	
24 V ———— D1		24 V ———— D1	
24 V ———— D2		24 V ———— D2	
24 V ———— D3		24 V ———— D3	

Safety precautions

To ensure safety, both safety outputs (LA and LB) must always be evaluated.

Notes on the electrical connection

- ▶ The operating voltage U_b is reverse polarity protected.
- ▶ The data outputs D0, D1, D2, D3 have no safety function.
- ▶ Both safety outputs LA and LB must be evaluated.
- ▶ The safety outputs LA and LB as well as the data outputs D0, D1, D2, D3 are short circuit-proof.
- ▶ All the electrical connections must either be isolated from the mains supply by a safety transformer according to IEC/EN 61558 with limited output voltage in the event of a fault, or by other equivalent isolation measures.
- ▶ If a common power supply is used, all the inductive and capacitive loads (e.g. contactors) connected to the power supply must be connected to appropriate interference suppression units.

Changing the approach direction

The active face of the read head can be adjusted in 5 directions. The face is marked with the EUCHNER logo. The center of the circle corresponds to the middle of the read head.

Typical operating distance (for safety actuator and position actuator)

For a side approach direction for the actuator and safety switch, a minimum distance of $s = 3 \text{ mm}$ must be maintained so that the operating distance of the side lobes is not entered.

¹⁾Clear zone (area of the active face without metal housing)

Notes on installation

- ▶ The connection cable must only be extended using EUCHNER plug connectors and adequate consideration must be given to EMC during assembly (see page 66). Intermediate terminals must not be used.
- ▶ Actuator and read head must be fitted so that:
 - ▶ The active faces (front faces) are at the switch-on distance $0.8 \times S_{a0}$ or closer (see technical data) with the safety guard closed.
 - ▶ They are not used as a mechanical stop.
 - ▶ They are positively connected to the safety guard, e.g. by using adhesive.
- ▶ The read head is allowed to be installed as a maximum up to the clear zone (area of the active face without metal housing).

Safety precautions

- ▶ If the read head is installed flush, the switching distance changes as a function of the installation depth and the safety guard material.

Typical operating distance

With evaluation unit CES-A-ABA-01 and actuator CES-A-BMB

With evaluation unit CES-A-ABA-01B/CES-A-AEA... and actuator CES-A-BMB

A minimum distance of $s = 1.2 \text{ mm}$ must be maintained.

Actuator CES-A-BDA

- ▶ Round design Ø 20 mm
- ▶ In combination with evaluation units CES-A-ABA-01 and read head CES-A-LNA/LCA...

Dimension drawing

Typical operating distance

Notes on installation

- ▶ Assembly on or in aluminum is not allowed.
- ▶ The safety guard must be designed so that:
 - ▶ A hazard is excluded up to a distance of $s_{ar} = 24$ mm (safe switching distance).
 - ▶ In the case that the adhesive joint for the actuator breaks, it is ensured that the actuator leaves the operating distance with a distance $> s_{ar}$ when the safety guard is opened.
- ▶ Actuator and read head must be fitted so that:
 - ▶ The active faces (front faces) are at the switch-on distance $0.8 \times s_{a0}$ or closer (see technical data) with the safety guard closed.
 - ▶ They are not used as a mechanical stop.
- ▶ For a side approach direction for the actuator and read head, a minimum distance of $s = 1$ mm must be maintained so that the operating distance of the side lobes is not entered.

Switching distances with read head cable length 0 to 25 m ¹⁾

Non-contact safety switches CEM

- ▶ **With transponder coding**
- ▶ **Integrated solenoid (without monitoring of the guard locking)**
- ▶ **Up to safety category 4**

Functional description

Non-contact safety switches CES have no guard locking. Therefore, there is a risk that the machining process may be interrupted if the safety door is opened unintentionally.

The safety switch CEM is the ideal solution for all customers who must achieve a high level of safety when securing a safety guard and also need guard locking to protect the process.

The guard locking on the safety switch CEM is not monitored by the system as per EN 1088. As a consequence, the switch can be used in all applications in which there are no hazardous, overtravel machine movements.

If the overtravel machine movements do not represent a hazard for the operator, the safety switch CEM can be used.

Design and functionality

The safety switch CEM comprises a CEM actuator and read head. A CES read head and a solenoid are integrated into the CEM read head. The CEM read head is connected to the CES evaluation unit with a round M8 plug connector. The CEM actuator of identical design also has a metal plate in addition to the transponder; this plate acts as an armature for the solenoid coil.

When the safety door is closed, the CEM actuator enters the operating distance of the CEM read head. The transponder signals are transferred, and then the evaluation unit closes the safety contacts and sets the OUT output "high". By applying voltage to the solenoid for the CEM read head, strong magnetic forces can be generated between the coil (in the read head) and the armature (in the actuator).

Depending on the switch design – EUCHNER provides two different housing sizes – adhesive forces of approx. 500 N or 1000 N respectively are applied between the CEM actuator and the CEM read head. Practical experience has shown that these magnetic adhesive forces effectively prevent any opening, even if the user applies an enormous amount of effort.

Use of the switch even in extremely harsh environments

The safety switches CEM have an extremely robust design. The high degree of protection IP 67 and the metal housing allow the switch to be used in extremely harsh environments. The armature plate for the CEM actuator has spring bearings and can be tilted up to an angle of $\pm 4^\circ$. Therefore, when a maladjusted safety door is closed, the CEM actuator adjusts itself independently to the surface of the CEM read head. It is not necessary to readjust the safety door when using the safety switch CEM. When mounting the safety switch CEM, it is only necessary to ensure that the CEM actuator is guided in front of the CEM read head when the door is closed, so that the strong adhesive forces can be generated.

Because the switch has only a small number of moving parts which can wear, the mechanical life of the CEM switch is virtually unlimited.

Different designs

EUCHNER provides two CEM housing designs. The two versions differ in their dimensions, according to the size of the solenoid. The safety switches CEM with an adhesive force of 1000 N are used with large, heavy safety doors. This read head has an additional M8 plug connector for connecting an external LED display. When voltage is applied to the coil, it is indicated to the user that the safety door is in the *locking position*. An LED display in the immediate vicinity of the door handle is extremely advantageous, especially in the case of large, solid doors.

The smaller version of the safety switch CEM has an adhesive force of approx. 500 N. It is suitable for securing smaller safety doors and safety flaps.

An LED indicator in the M8 plug on the CEM A LE05K S2 read head indicates to the user when voltage is applied to the solenoid.

Highest possible level of safety is achieved

EUCHNER offers various evaluation units for the safety switch CEM:

- ▶ For the connection of one read head, the evaluation unit CES-A-ABA-01B (safety category 3)
- ▶ For the connection of one/two read heads, the evaluation unit CES-A-ABA-02B (safety category 4)
- ▶ For the connection of up to four read heads, the evaluation unit CES-A-ABA-04B (safety category 4).

In combined operation, it is possible to connect both CES read heads (without guard locking) and CEM read heads to an evaluation unit.

In the case of relatively large systems with several safety doors to be monitored, it is advisable to lock the frequently used doors during the production cycle – e.g. the doors in a cycling loading station – to prevent the process being interrupted if the door is opened. On doors that are not opened very often – e.g. maintenance doors – a safety switch without guard locking is adequate in many applications.

As the safety switch CEM only safely monitors the position of the door and not the function of the guard locking, the switch can be used in all systems without dangerous, overtravel machine movements. The solenoid has the task of protecting the process; it effectively prevents the unintentional opening of the safety guard by the user.

With the two safety switches CES and CEM, EUCHNER has launched on the market a totally new safety concept that is significantly different to competitive solutions.

Your advantages

- ▶ Safety switch with transponder coding
 - ▶ Every actuator is unique
 - ▶ Absolutely secure against tampering
- ▶ Very high level of safety with one switch
 - ▶ With evaluation unit CES-A-ABA-01B safety category 3 according to EN 954-1
 - ▶ With evaluation unit CES-A-AEA-02B and CES-A-AEA-04B safety category 4 according to EN 954-1
- ▶ Integrated solenoid for process protection
 - ▶ Unintentional opening of the safety door is prevented
- ▶ Safety switch and solenoid form a single compact unit
- ▶ High adhesive forces from the solenoids (500 N or 1000 N)
 - ▶ Protection of the machining process
- ▶ Simple operating principle
 - ▶ No wearing parts
- ▶ Robust housing for harsh environments
- ▶ Connection via M8 plug connector
 - ▶ Low wiring effort
 - ▶ Easy to replace if servicing is required
- ▶ Approval from BG

Read head CEM-A-LE05K-S2

- ▶ **Adhesive force 500 N**
- ▶ **In combination with evaluation unit CES-A-ABA-01B/ CES-A-AEA.../CES-A-F1B-01B-AS1 and actuator CEM-A-BE05**
- ▶ **M8 plug connector**
Connection cable for evaluation unit, see page 64
Connection cable for solenoid operating voltage, see page 62

Dimension drawing

Note

- ▶ The actuators and read heads CEM... can only be used with the evaluation units given above.
- ▶ The plug connectors S1 and S3 are suitable for snap-action and screw terminals.
- ▶ For detailed information see the operating instructions for the CES evaluation unit used.

Notes on installation

- ▶ The connection cable to the CES evaluation unit must only be extended using EUCHNER plug connectors and adequate consideration must be given to EMC during assembly (see page 66). Intermediate terminals must not be used.
- ▶ Actuator and read head must be fitted so that:
 - ▶ They are positively connected to the safety guard, e.g. by using safety screws.
 - ▶ When the safety door is opened, the actuator is moved in the axial direction (frontal) away from the read head.

Notes on the electrical connection

- ▶ All the electrical connections must either be isolated from the mains supply by a safety transformer according to EN/IEC 61558 with limited output voltage in the event of a fault, or by other equivalent isolation measures.
- ▶ If a common power supply is used, all the inductive and capacitive loads (e.g. contactors) connected to the power supply must be connected to appropriate interference suppression units.

Safety precautions

- ▶ The surface of the solenoid and the mating plate may become hot. Protection against accidental contact or adequate heat dissipation must be provided by mounting the read head on metal.
- ▶ The safety switch CEM... with solenoid is not allowed to be used for the protection of personnel as per EN 1088.

Solenoid				
Adhesive force in axial direction	1000			N
Adhesive force due to remanence	Approx. 0.7			N
Solenoid center offset max.	± 2.5			mm
Solenoid operating voltage U _B plug S1	20.4	24	26.4	V DC
Reverse polarity protection	Yes			
Current consumption at connection S1.2 (U _B)	225			mA
at connection S1.1 (M _{ON})	15 (without external LED)			
Power consumption	Approx. 5.8			W
Switch-off delay	750			ms
Solenoid operating voltage connection	M8 plug connector (plug), 4-pin			
External LED indicator connection	M8 plug connector (socket), 4-pin			
Read head				
Operating distance for center offset m = 0				mm
- Safe switch-off distance S _{ar}	-	-	20	
Cable length l = 0 to 25 m				
- Switch-on distance S _{a0}	-	2	-	
- Switching hysteresis	-	0.7	-	
Cable length l = 25 to 50 m				
- Switch-on distance S _{a0}	-	1.6	-	
- Switching hysteresis	-	0.6	-	
Connection evaluation unit plug S3	M8 plug connector (plug), 3-pin			
Connection cable	-	-	50	m
Connection external LED indicator plug S2				
Current consumption	-	-	500	mA

Cable outlet, angled plug connector

Connection variants read head CEM-A-LH10K-S3

Cable outlet, straight plug connector

Cable outlet, angled plug connector

Actuator CEM-A-BE05

- ▶ Adhesive force 500 N
- ▶ In combination with read head CEM-A-LE05K-S2 or CEM-A-LE05R-S2

Dimension drawing

Note

- ▶ The actuators CEM... can only be used with the evaluation units given above.
- ▶ For detailed information see the operating instructions for the CES evaluation unit used.

Notes on installation

- ▶ Actuator and read head must be fitted so that:
 - ▶ They are positively connected to the safety guard, e.g. by using safety screws.
 - ▶ When the safety door is opened, the actuator is moved in the axial direction (frontal) away from the read head.

Safety precautions

- ▶ The surface of the solenoid and the mating plate may become hot. Protection against accidental contact or adequate heat dissipation must be provided by mounting the read head on metal.
- ▶ The safety switch CEM... with solenoid is not allowed to be used for the protection of personnel as per EN 1088.

Technical data

Parameters	Value			Unit
General	min.	typ.	max.	
Housing material	Aluminum			
Material, actuator CES	Plastic (PPS)			
Solenoid mating plate material	Galvanized steel			
Weight	Approx. 0.18			kg
Ambient temperature	-25	-	+50	°C
Degree of protection according to IEC 60529	IP67			
Installation position	Active face opposite read head			
Adjustment angle (around point X, see dimension drawing)	± 4			°

Plug connector for safety switch CES-A-S5...	096 490

Plug connector for read head CES-A-L...

Using EUCHNER couplings / plug connectors, the user can cut the read head cable to size on site at any point and connect the couplings / plug connectors.

Note

The connection cable for the read head can only be extended using these self-assembly couplings / plug connectors under the following conditions:

- ▶ The total maximum cable length is 50 m, taking into account the switch-on distance.
- ▶ The cable specified by EUCHNER must be used for the extension (screened, conductor cross-section 2 x 0.25 mm²).
- ▶ The plug connector housing must be electrically isolated from the machine ground.

Appendix

- Definition of terms
- Index

Definition of terms

Door monitoring output	The door monitoring output is not a safety-related output; it may not be connected to the safety circuit. The door monitoring output is generally connected to a higher-level control system to indicate the position of the doors (open/closed) on a visual display.
Dwell time	The dwell time is the time that the actuator must be inside or outside the operating distance.
Fault detection time	The fault detection time is the time for the detection of an internal fault in the device. At least one of the relay outputs is opened safely. The welding of one of the relay contacts is only detected after the safety guard is opened.
PDF	Proximity device with defined behavior under fault conditions (see EN 60 947-5-3).
PDF-M	PDF proximity devices with automatic control that do not lose their defined behavior in spite of several faults (see EN 60 947-5-3).
PDF-S	PDF proximity devices that do not lose their defined behavior in spite of a single fault (see EN 60947 5 3).
Safety class III	Equipment of safety class III is equipment on which protection against electric shock is based on safety extra-low voltage and is equipment in which no voltages higher than the safety extra-low voltage are produced.
Safety extra-low voltage	Voltage of a magnitude that does not pose an immediate risk to people. It provides safe electrical isolation from higher voltage power circuits and is used isolated from ground.
Safety output	The safety output is a safety-related output that may be connected to the safety circuit. A safety output can be switched via relay contacts or semiconductor elements.
S_{ar}	Assured switch-off distance S _{ar} Distance from the active face within which the correct detection of the absence of a defined object is achieved under all defined environmental conditions, manufacturer's tolerances and internal component faults.
S_{a0}	Assured switch-on distance S _{a0} Distance from the active face within which the correct detection of the presence of a defined object is achieved under all defined environmental conditions and manufacturer's tolerances.
Switching delay from state change	Corresponds to the risk time according to EN 60947-5-3. This is the maximum switch-off delay for the safety outputs following removal of the actuator.
